Professional Summary

Software engineering professional with a career in technology since 2018, spanning frontend development, technical support, and software quality assurance. Performed testing as part of technical support responsibilities before transitioning formally into QA in 2021. Over time, expanded responsibilities to include feature implementation, systems integration, automation, and technical documentation, applying a quality engineering perspective throughout software development and maintenance.

Contributed to web applications using Vue.js and JavaScript, mobile applications using React Native and TypeScript, and backend systems using C#/.NET and Java with Spring Boot. Experience includes feature implementation, refactoring domain rules using Domain-Driven Design (DDD) principles, handling asynchronous operations and integration failures, and testing services, components, HTTP contracts, and user journeys. Holds a postgraduate specialization in Software Engineering from Unisinos.

Professional Experience

Independent Software Engineering Consultant

August 2021 – Present | Software Engineering, Integrations, Testing, and Documentation

Contributions to applications maintained as part of projects for clients, including international clients, alongside other professional engagements. The periods below reflect documented contributions to each project.

Customer Web Portal | Vue.js, JavaScript, and Axios | 2026

- Implemented shared tax identification validation across registration forms, reusing in-flight requests, discarding stale responses, and preventing concurrent submissions.
- Developed coordinated session renewal and controlled request retries to handle simultaneous authentication failures.
- Coordinated dashboard queries and language loading, validating the current selection and providing local fallback messages.
- Enhanced parking, notification, fine lookup, and financial transaction correlation workflows, validating business responses before displaying success states.
- Created service, component, and contract tests using the Node.js Test Runner, as well as registration scenarios using Playwright.

Mobility and Payments Mobile Application | React Native and TypeScript | 2026

- Implemented and corrected registration, parking, location, and fine lookup workflows, including API response handling.
- Established Jest testing infrastructure and Android end-to-end automation with Detox, including helpers, fixtures, selectors, and diagnostic artifacts.

- Developed checks comparing UI data, API states before and after transactions, amounts, and balances for the covered transactional scenarios.
- Documented successful login and session persistence test execution on a physical Android device.
- Configured code checks, automated changelog generation, and version traceability; documented requirements, dependencies, and test coverage gaps.

Tax Registration and Validation | C#/.NET, ASP.NET Core, and NUnit | 2026

- Extracted legacy validation logic into a reusable domain module with interfaces, dependency injection, and a catalog organized by country and account-holder type.
- Implemented and integrated normalization, format, and check-digit rules, explicitly distinguishing format validation, checksum verification, and heuristic assessment.
- Organized a catalog covering 57 country and territory codes and 114 country/account-holder combinations: 44 checksum entries and 70 pre-existing format definitions integrated into the module.
- Implemented a local validation endpoint and integrated validation into individual and company creation and update models.
- Created domain tests, legacy characterization tests, and HTTP contract tests using an isolated host; configured test execution and result publishing in Azure Pipelines.

Parking and Pricing Backend | C#/.NET, xUnit, and Moq | 2026

- Developed tests for existing rules covering queries, renewals, pricing, fees, exemptions, and rounding.
- Verified HTTP contracts using mocked responses, including methods, payloads, dates, and identifiers.
- Organized test projects and documented architecture, data models, pricing rules, and integrations using Mermaid diagrams.

Fire Safety Services Website (PPCI) | React and TypeScript | 2026

- Contributed to configuring the Decap CMS editorial workflow for drafting, review, and content publication, including test and documentation updates.
- Optimized page performance and script loading.
- Updated CI configuration.

Educational Simulator | Unity, C#, and NUnit | September 2023 – March 2024 (documented contributions)

- Created and maintained acceptance tests using the Unity Test Framework and coroutines, reproducing interaction journeys across scenes and user interfaces.
- Contributed to at least 11 simulation test cases covering primary, negative, and alternative flows, with explicit checks for instructions and messages in some tests.
- Organized and standardized test scenarios and documentation, and contributed to simulation content configuration.

DBServer — Software Test Analyst / Quality Engineer

July 2022 – August 2026

- Planned and executed web, mobile, and API testing, from requirements refinement through release validation, defining test scenarios and acceptance criteria.

- Developed and maintained test automation using Java, Selenium WebDriver, Maven, Cucumber, and the Page Object pattern; participated in the transition toward TypeScript and Playwright.
- Worked on native mobile test automation integrated into CI/CD, with execution on the Perfecto platform.
- Investigated failures through SQL queries, business rule analysis, and issue reproduction in collaboration with developers.
- Conducted mentoring sessions, technical training, and presentations within the internal software quality community.
- Delivered training as part of internal company programs.
- Conducted in-person mentoring and support activities for client teams.

Vortigo Digital — Software Test Analyst / QA

June 2021 – January 2023

- Prepared test plans, test cases, and scenarios; monitored feature development and validated releases.
- Tracked defects, investigated root causes, monitored application crashes, and analyzed data using SQL in Scrum and Kanban teams.
- Gradually reduced responsibilities until the engagement ended, overlapping with the start of the role at DBServer.

Earlier Experience in Technical Support and Frontend Development

- **Vortigo Digital — Technical Support | December 2019 – June 2021:** Provided Level 1–3 support, maintained web and mobile applications, and performed testing as part of technical support responsibilities.
- **POP3DEV — Frontend Developer | September 2018 – November 2019:** Worked on PHP, Laravel, and WordPress projects, supporting ERP migration and functional validation.
- **Ondaweb — Frontend Developer | March – September 2018:** Developed and maintained WordPress websites, implemented functional and visual fixes, and provided technical support.

Technical Skills

- **Web and mobile:** Vue.js and JavaScript for customer-facing web applications; React Native and TypeScript for mobile applications; React and TypeScript for portfolio and fire safety services website projects.
- **Backend and integrations:** C#/.NET, ASP.NET Core, domain rules, dependency injection, refactoring, API consumption, and HTTP contract verification.
- **Testing:** Node.js Test Runner and Playwright for web applications; Jest and Detox for mobile; NUnit, xUnit, and Moq for .NET; Unity Test Framework for simulation testing; Java, Selenium, Maven, and Cucumber for web automation.
- **Data and diagnostics:** SQL, API response analysis, defect reproduction, and comparisons between UI and backend data.
- **Delivery and documentation:** Git, Azure Pipelines and GitHub Actions configuration, changelogs, Markdown, Mermaid diagrams, and Decap CMS for the fire safety services website.

Education

Postgraduate Specialization in Software Engineering — Unisinos
March – December 2025 · Completed.

Associate-Level Technology Degree in Systems Analysis and Development — UNINTER
March 2018 – May 2022 · Completed.
